

5 The third section 186 extends distally from the distal end of the second section 184. The third section 186 has a substantially continuous cross-section dimension. The third section 186 may also include small diameter changes along its length. The third section preferably includes a seal 187 formed around the outer periphery of the third section 186. As ultrasonic energy passes from the second section 184 of the ultrasonic waveguide 179 into the third section 186, the narrowing of the third section 186 will result in an increased amplitude of the ultrasonic energy passing therethrough.

10 The third section 186 may have a plurality of grooves or notches (not shown) formed in its outer circumference. The grooves may be located at nodes of the ultrasonic waveguide 179 or any other suitable point along the ultrasonic waveguide 179 to act as alignment indicators for the installation of a damping sheath 110 during manufacturing.

15 Still referring to Figure 2, damping sheath 110 of the surgical instrument 150 surrounds at least a portion of the ultrasonic waveguide 179. The damping sheath 110 may be positioned around the ultrasonic waveguide 179 to dampen or limit transverse side-to-side vibration of the ultrasonic waveguide 179 during operation. The damping sheath 110 preferably surrounds part of the second section 184 of the ultrasonic waveguide 179. It is contemplated that the damping sheath 110 may be positioned around any suitable portion of the ultrasonic waveguide 179. The damping sheath 110 preferably extends over at least one antinode of transverse vibration, and more preferably, a plurality of antinodes of transverse vibration. The damping sheath 110 preferably has a substantially circular cross-section. It will be recognized that the damping sheath 110 may have any suitable shape to fit over the ultrasonic waveguide 179 and may be any suitable length.

30 The damping sheath 110 is preferably in light contact with the ultrasonic waveguide 179 to absorb unwanted ultrasonic energy from the ultrasonic waveguide 179. The damping sheath 110 reduces the amplitude of non-axial

vibrations of the ultrasonic waveguide 179, such as, unwanted transverse vibrations associated with the longitudinal frequency of 55,500 Hz as well as other higher and lower frequencies.

5 The damping sheath 110 is constructed of a polymeric material, preferably with a low coefficient of friction to minimize dissipation of energy from the axial motion or longitudinal vibration of the ultrasonic waveguide 179. The polymeric material is preferably flourea-ethylene propene (FEP) which resists degradation when sterilized using gamma radiation. It will be recognized that the damping
10 sheath 110 may be fabricated from any suitable material, such as, for example, PTFE.

 The damping sheath 110 preferably has an opening extending therethrough, and a longitudinal slit 111. The slit 111 of the damping sheath 110 allows the
15 damping sheath 110 to be assembled over the ultrasonic waveguide 179 from either end. It will be recognized that the damping sheath 110 may have any suitable configuration to allow the damping sheath 110 to fit over the ultrasonic waveguide 179. For example, the damping sheath 110 may be formed as a coil or spiral or may have patterns of longitudinal and/or circumferential slits or slots. It is also
20 contemplated that the damping sheath 110 may be fabricated without a slit 111 and the ultrasonic waveguide 179 may be fabricated from two or more parts to fit within the damping sheath 110.

 It will be recognized that the ultrasonic waveguide 179 may have any
25 suitable cross-sectional dimension. For example, the ultrasonic waveguide 179 may have a substantially uniform cross-section or the ultrasonic waveguide 179 may be tapered at various sections or may be tapered along its entire length.

 The ultrasonic waveguide 179 may also amplify the mechanical vibrations
30 transmitted through the ultrasonic waveguide 179 to the ultrasonic blade 88 as is well known in the art. The ultrasonic waveguide 179 may further have features to control the gain of the longitudinal vibration along the ultrasonic waveguide 179

and features to tune the ultrasonic waveguide 179 to the resonant frequency of the system.

5 The proximal end of the third section 186 of ultrasonic waveguide 179 may be coupled to the distal end of the second section 184 by an internal threaded connection, preferably near an antinode. It is contemplated that the third section 186 may be attached to the second section 184 by any suitable means, such as a welded joint or the like. Third section 186 includes ultrasonic blade 88. Although the ultrasonic blade 88 may be detachable from the ultrasonic waveguide 179, the
10 ultrasonic blade 88 and ultrasonic waveguide 179 are preferably formed as a single unit.

The ultrasonic blade 88 may have a length substantially equal to an integral multiple of one-half system wavelengths ($n\lambda/2$). The distal end of ultrasonic blade
15 88 may be disposed near an antinode in order to provide the maximum longitudinal excursion of the distal end. When the transducer assembly is energized, the distal end of the ultrasonic blade 88 is configured to move in the range of, for example, approximately 10 to 500 microns peak-to-peak, and preferably in the range of about 30 to 150 microns at a predetermined vibrational frequency.

20 The ultrasonic blade 88 is preferably made from a solid core shaft constructed of material which propagates ultrasonic energy, such as a titanium alloy (i.e., Ti-6Al-4V) or an aluminum alloy. It will be recognized that the ultrasonic blade 88 may be fabricated from any other suitable material. It is also
25 contemplated that the ultrasonic blade 88 may have a surface treatment to improve the delivery of energy and desired tissue effect. For example, the ultrasonic blade 88 may be micro-finished, coated, plated, etched, grit-blasted, roughened or scored to enhance coagulation and cutting of tissue and/or reduce adherence of tissue and blood to the end-effector. Additionally, the ultrasonic blade 88 may be
30 sharpened or shaped to enhance its characteristics. For example, the ultrasonic blade 88 may be blade shaped, hook shaped, or ball shaped.
